SNOVASYS
We Love To Help You Succeed

JOB DESCRIPTION · 2026–2027

Forward Deployed Engineer

Client-Embedded Engineering, Solution Delivery & AI Agent Orchestration

Own the requirement end to end — from the first client conversation to validated delivery in the client's environment.

About Snovasys

Snovasys Software Solutions Ltd is 16+ years old Software Solutions and Services Company based in London along with development centers in India (Ongole). Joining location would be Ongole. Over the past 12 years, we had been conducting placements across various reputed institutes in Andhra Pradesh. Number of students have already taken advantage of this excellent opportunity.

Snovasys is an enterprise application development and is ISO certified. We at Snovasys strongly believe in using tomorrow's technologies to solve today's needs. Cutting edge technologies and processes that Industry can look up to is a norm in Snovasys.

About the Role

We are looking for highly analytical and adaptable engineers who can take ownership of a business requirement from initial client discussion to successful delivery.

As a **Forward Deployed Engineer**, you will work embedded with our clients — alongside their business and technical teams — to understand how they operate, build and deploy solutions directly in their environment, and make sure those solutions deliver real, measurable value.

The ideal candidate should be capable of understanding what the client actually needs, converting business problems into actionable technical requirements, researching and gathering information using AI, designing solutions, and using AI tools and autonomous AI agents as virtual team members to accelerate execution.

> The expectation is **not simply to use AI for coding**. The candidate should learn to build AI-assisted workflows and autonomous loops where AI agents can research, analyze, generate, implement, test, document, monitor, and improve work under appropriate human supervision.

The candidate will work closely with clients and internal teams and will be accountable for achieving the required **business outcome** rather than only completing an assigned technical task.

Key Responsibilities

1 Forward Deployment & Client Embedding

- Work embedded with client teams — on-site or remotely — as the primary technical point of contact for the engagement.
- Learn the client's business, operations, data, and existing systems deeply enough to act as a trusted technical advisor.
- Deploy, configure, and customize our products and solutions within the client's infrastructure and environment.
- Integrate solutions with the client's existing applications, data sources, identity systems, and enterprise tools.
- Rapidly build proofs of concept, pilots, and prototypes that demonstrate value on the client's real problems.
- Take production-grade solutions live and own their stability, performance, and reliability after go-live.
- Troubleshoot and resolve technical issues in client environments, including urgent production incidents.
- Navigate client security, compliance, access, and change-management processes during deployment.

2 Requirement Discovery & Client Engagement

- Work directly with clients and stakeholders to understand their business problems, workflows, objectives, and expected outcomes.
- Conduct requirement-gathering sessions, discussions, interviews, demonstrations, and follow-ups.
- Identify the actual business requirement behind the client's initial request.
- Ask the right questions to uncover missing requirements, dependencies, constraints, and edge cases.
- Document business requirements, functional requirements, workflows, acceptance criteria, and expected outcomes.
- Convert ambiguous requirements into clear, actionable tasks.
- Maintain continuous communication with clients throughout the delivery lifecycle.
- Demonstrate completed functionality to clients and collect feedback.
- Manage requirement changes and ensure that the delivered solution continues to meet the intended business objective.

3 AI-Assisted Research & Information Gathering

- Use modern AI tools and LLMs to rapidly research technologies, business domains, existing systems, APIs, competitors, documentation, implementation approaches, and potential solutions.
- Use AI to analyze large amounts of documentation, requirements, logs, code, data, and technical information.

- Build reusable prompts, workflows, context libraries, and AI-assisted processes.
- Validate AI-generated information rather than blindly accepting AI output.
- Identify gaps, contradictions, hallucinations, security concerns, and incorrect assumptions in AI-generated results.
- Continuously experiment with new AI capabilities and determine where they can improve delivery efficiency.

4 AI Agent & Autonomous Workflow Orchestration

- Use AI agents as virtual team members for different stages of product delivery.
- Design workflows where multiple specialized AI agents can work together.
- Assign appropriate responsibilities to AI agents such as:
  - Requirement Analyst · Research Agent · Solution Architect
  - Developer Agent · Code Review Agent · Testing Agent
  - Documentation Agent · Data Analysis Agent
  - Security Review Agent · Deployment / Operations Agent
- Build autonomous or semi-autonomous loops for repetitive engineering and business processes.
- Design workflows where AI can perform a task, evaluate the result, identify gaps, and iterate toward the required outcome.
- Establish appropriate human checkpoints for requirements, architecture, security, production changes, and other critical decisions.
- Monitor AI-agent outputs and continuously improve agent instructions, tools, context, and workflows.

5 Solution Design & Software Development

- Translate business requirements into technical solutions and implementation plans.
- Design application architecture, APIs, databases, integrations, workflows, and user experiences.
- Develop software using appropriate programming languages, frameworks, databases, and cloud technologies.
- Use AI coding assistants and AI agents extensively for development while maintaining responsibility for the quality and correctness of the final implementation.
- Review, understand, debug, modify, and maintain AI-generated code.
- Develop both frontend and backend components when required.
- Integrate third-party APIs, services, databases, and enterprise systems.
- Build scalable, secure, maintainable, and production-ready applications.

6 AI-Driven Testing & Quality

- Convert requirements and acceptance criteria into test scenarios.
- Use AI to generate test cases, edge cases, test data, automation scripts, and regression scenarios.
- Perform functional, integration, API, performance, and security testing as required.

- Use AI agents to analyze failures, logs, defects, and test results.
- Ensure that AI-generated implementations actually satisfy the original business requirement.
- Identify defects and coordinate their resolution.
- Validate the complete solution before presenting it to the client.

7 End-to-End Delivery Ownership

The candidate is expected to own the complete lifecycle of a requirement:

> **Client Requirement → Discovery → Analysis → Research → Solution Design → Planning → AI-Agent Orchestration → Development → Testing → Deployment → Client Validation → Feedback → Improvement**

The candidate should be able to independently drive work forward rather than waiting for every task to be assigned individually.

8 Client Enablement, Adoption & Field Feedback

- Train client users and technical teams so they can adopt, operate, and get value from the delivered solution.
- Prepare deployment guides, runbooks, handover documentation, and knowledge-transfer material for clients.
- Track adoption and business impact after go-live, and proactively identify opportunities to expand value.
- Capture recurring client needs, product gaps, and field insights, and feed them back to internal product and engineering teams.
- Turn repeatable client-specific solutions into reusable components, templates, and deployment playbooks.

9 Continuous Improvement & Autonomous Execution

- Identify repetitive manual processes that can be automated.
- Design AI-assisted or autonomous workflows to reduce engineering and operational effort.
- Build internal tools and automation wherever appropriate.
- Continuously evaluate whether a task should be performed manually, automated traditionally, assisted by AI, or delegated to an AI agent.
- Measure the effectiveness of AI workflows based on quality, speed, reliability, and business outcomes.
- Continuously improve existing AI-agent workflows based on failures and feedback.

What We Expect

Business & Client Skills

- Strong communication and interpersonal skills.
- Ability to communicate effectively with both technical and non-technical stakeholders.
- Ability to understand business processes and workflows.
- Ability to ask meaningful questions and challenge unclear requirements constructively.
- Strong documentation and presentation skills.
- Ability to manage client discussions and follow-ups.

Technical Skills

- Strong programming fundamentals and logical thinking.
- Understanding of software development lifecycle.
- Knowledge of web applications, APIs, databases, and software architecture.
- Ability to learn and work across frontend, backend, testing, deployment, and AI technologies.
- Understanding of Git, APIs, databases, debugging, and basic deployment concepts.
- Ability to understand existing codebases and systems quickly.

AI Skills

- Strong practical understanding of LLMs and modern AI tools.
- Experience with AI coding assistants and AI development tools.
- Ability to write effective prompts and provide structured context to AI.
- Understanding of AI agents and multi-agent workflows.
- Ability to design AI-assisted autonomous loops.
- Ability to evaluate and validate AI-generated output.
- Understanding of AI limitations, hallucinations, security, privacy, and responsible AI usage.
- Willingness to continuously learn emerging AI technologies.

Ideal Candidate Mindset

We are looking for someone who thinks:

> *"Here is the problem. I will figure out what is required, gather the necessary information, determine the best approach, assemble the right AI and human resources, execute the work, validate the result, and deliver the required outcome."*

The candidate should not be limited to a narrow, predefined scope of work. Instead, they should be capable of taking on whatever the client requirement demands — from discovery and design to development, testing, and deployment.

They should be comfortable working in an environment where AI is treated as an extension of the engineering team and where the human engineer is responsible for orchestrating, validating, and

directing AI systems toward the desired outcome.

Example of Expected Working Model

For a new client requirement, the candidate may be expected to:

1. Meet the client and understand the business problem.
2. Ask questions and document the requirement.
3. Use AI to analyze existing documentation and research possible solutions.
4. Identify missing information and clarify it with the client.
5. Convert the requirement into technical specifications and acceptance criteria.
6. Create an implementation plan.
7. Assign different parts of the work to appropriate AI agents.
8. Use AI coding agents to implement the solution.
9. Use testing agents to generate and execute test scenarios.
10. Review and validate the generated implementation.
11. Fix issues identified during testing.
12. Deploy the solution through the appropriate process.
13. Demonstrate the result to the client.
14. Collect feedback.
15. Feed the feedback back into the development loop.
16. Continue iterating until the agreed requirement is successfully delivered.

Core Competencies

Forward Deployment | Client-Site Integration | Requirement Engineering | Client Communication | Business Analysis | Software Engineering | Full-Stack Development | AI-Assisted Development | AI Agent Orchestration | Prompt Engineering | Workflow Automation | Autonomous AI Workflows | Software Testing | Technical Research | Problem Solving | System Design | API & Database Integration | Documentation | Deployment & Troubleshooting | Client Enablement | Continuous Improvement

Success in This Role

Success will **not** be measured only by the amount of code written. The candidate will be expected to demonstrate the ability to:

- Understand the client's actual problem.
- Convert ambiguity into clear requirements.

- Use AI effectively to accelerate research and execution.
- Build and orchestrate AI-agent workflows.
- Deliver working software in the client's environment.
- Validate that the solution satisfies the business requirement.
- Communicate effectively with clients.
- Resolve problems independently.
- Reduce repetitive manual effort through automation.
- Continuously improve the way work is performed.
- Take ownership of outcomes from requirement to delivery.

Qualification

- Any Graduate with strong analytical and logical abilities.
- Strong programming fundamentals.
- Excellent communication skills.
- Willingness to work extensively with AI tools and emerging technologies.
- Candidates with projects demonstrating practical use of AI, automation, software development, or agent-based workflows will be preferred.

Salary Structure

> ANNUAL CTC AFTER PROBATION **7 LPA+**

Stage	Pay	Duration
Internship	Stipend of INR 18,000 per month	As applicable
Probation	INR 25,000 per month	6 months
Year 1 onwards	7 LPA+ (7 Lakhs+ per annum)	After probation

- There will be an annual appraisal based on performance; salary increments will range from **5% to 30%**.
- Both pay and probation period are subject to approval in the final offer letter.
- Probation does not include the internship period.
- The Year 1 salary begins upon successful completion of the probation period.

Selection Process

The selection process consists of **four rounds**. Rounds 1 and 2 are conducted online. Rounds 3 and 4 are conducted offline, in person at our office. Candidates must clear each round to be considered for the next.

ROUND 1 **Online Assessment** Online

A screening assessment covering aptitude, logical reasoning, and communication. The section-wise pattern is given below.

Round 1 — Online Assessment Pattern

Order	Section	Questions	Time
1	Aptitude	60 Q	20 min
2	Logical Reasoning	60 Q	20 min
3	Communication	60 Q	20 min
	Total	**180 Q**	**60 min**

Sections are served in the order shown above, and each section is individually timed.

ROUND 2 **Online Assessment** Online

A second online assessment for candidates shortlisted from Round 1. The pattern and duration for this round will be shared with shortlisted candidates along with the assessment invite.

ROUND 3 **Interview — at our office** Offline

An in-person interview conducted at our office. Depending on the panel and the candidate's profile, this round may be technical, managerial, or HR in nature — or a combination of these.

ROUND 4 **Interview — at our office** Offline

A final in-person interview conducted at our office. As with Round 3, the focus may be technical, managerial, or HR, and will be decided based on the candidate's profile and performance in the earlier rounds.

Candidates are requested to carry a valid photo ID and a copy of their resume for the offline rounds. Dates, venue, and reporting time will be communicated by the recruitment team in advance.

Work Environment

This role is designed for an **AI-first software delivery environment**. Candidates will be expected to continuously learn, experiment, and adapt as AI capabilities evolve.

The specific technologies and tools may change over time; therefore, **the ability to learn new tools and apply them effectively is more important than knowledge of any single AI platform.**
